

## **Day 3 - HTML Fundamentals + Introduction to CSS**

Date: 26 June 2025

The Day 3 session of the Web Development Training combined the fundamentals of HTML with an introduction to CSS (Cascading Style Sheets). Participants reinforced their understanding of HTML structure and learned how CSS is used to style and enhance the visual presentation of web pages.

Key topics covered included:

- Revisiting essential HTML tags and attributes for building webpage structure.
- Understanding the difference between inline, internal, and external CSS.
- Learning CSS syntax – selectors, properties, and values.
- Applying basic styling such as colors, fonts, backgrounds, and borders.
- Understanding the concept of the CSS box model (margin, border, padding, and content).

During the practical portion, participants styled simple HTML layouts by adding external CSS files and experimenting with different design properties. The session concluded with exercises focused on linking stylesheets and improving page aesthetics, preparing learners for more advanced CSS techniques in the upcoming sessions.
